It's time for smart living

# MEET THE SUPERMAN OF SMART DEVICES

If your smart devices are partly wired and partly wireless, don't worry about it. The TIS Smart Home Company is here to make sure that you are not limited by a variety of configurations. Enjoy the company of the ultimate smart technology on the road to a limitless life experience. The AIR-BUS Converter, now available for wireless and wiring devices, creates real business value for you.

This converter bridges the gap between wired and wireless devices. This means that if you have a cabled wall panel and an air ceiling sensor, they can be integrated and controlled concurrently. When you are on the way home, turn on your AC, brighten your living room lights, and turn on the microwave oven to warm up some food. All of these are possible with a few touches of your fingertips.

Air Bus is a mini converter that instantly upgrades your home. All you need to do is mount the device next to or behind a wired module and set it with your phone application.

This solution can be used either to link wired devices to WIFI and enable remote control or to transform a number of solutions (Luna, Mars, Terre series) into WIFI Air panels. For instance, adding WIFI protocol to the Luna TFT panel in your office enables remote control, so you could use the Luna panel to activate the main AC via your cell phone. The Air Bus Converter also acts as a panel addition for all wall panels without the need for classic ones.

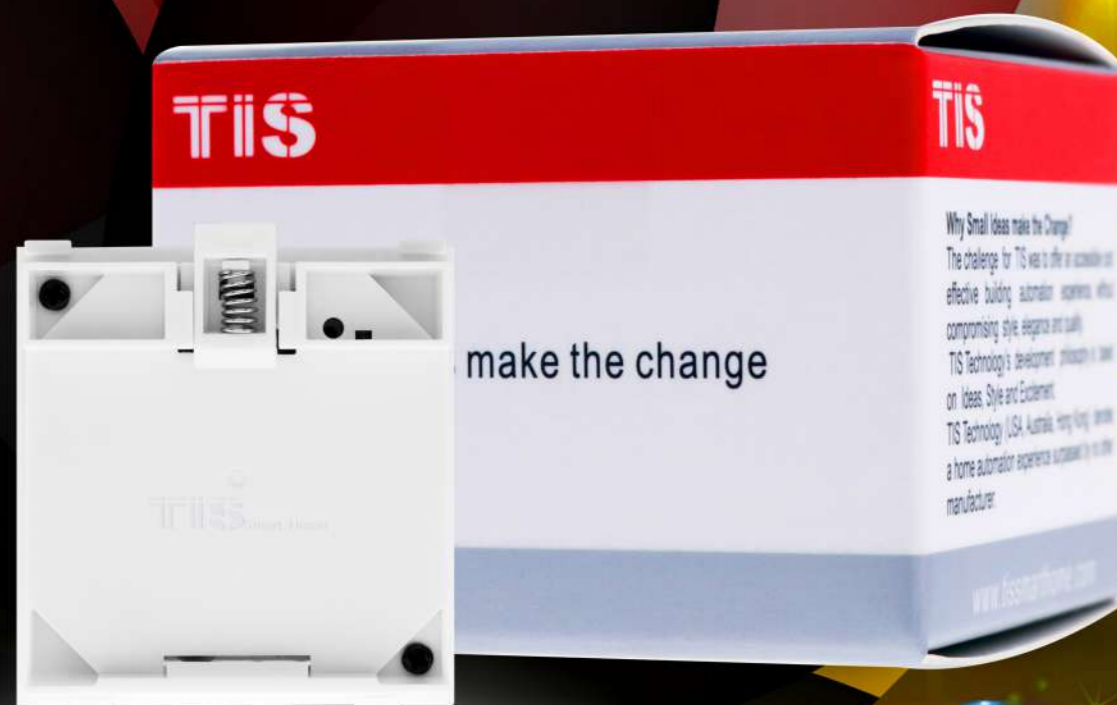

The Air Bus converter can come with or without a power supply. The TIS Air-Bus does not provide power for your device, but if you install the TIS Air-Bus-3W, it can supply the solution's power. This means that a wired solution, such as the Luna 9G panel, can function even without cabling.

Additionally, this device has multiple logics for defining specific smart-solution performances, and it has a scheduler that enables you to synchronize performance across all devices. The Air-Bus Converter is essentially an umbrella solution for the TIS IP Port and TIS Automation Timer; though it is a small device, it covers all of their functions.

As you can see, the Air Bus Converter is the superman of automation devices with highly qualified performance that makes controlling all types of devices a piece of cake.

# Just try it.
