IP-COM-PORT

64

TIS introduces products that not only outperform all of your smart needs, but also stand significantly above other solutions due to the arsenal of features that each product offers. For instance, IP-Com-Port is a communication module engineered to connect BUS networks and create a smart world with endless options.

Especially suited for big projects, TIS's IP-Com-Port unifies and incorporates all of your smart components to make them easier to manage. TIS-BUS wiring topology covers up to 64 devices per cable.

# TISBUS

In projects with numerous elements, an IP port can be added to each network so that all become integrated. Using IP modules and Ethernet cables, controlling the light, climate, and security system in a building the size of a skyscraper becomes simple and convenient.

# Modbus

01

Also, this module connects the BUS network to the wireless gateway, enabling you to control your home even while you are away. There is no need for network dongles or adapters.

02

Just install the TIS app on your smart phone, and monitor your living/work space remotely. If you want to merge solutions from different brands, the IP-Com-Port is just what you need.

03

Being compatible with the Modbus protocol, this solution is enhanced in terms of the number of logic controllers it can connect.

04

Third-party integration is also possible. You can connect all the electric locks, VRV AC systems, and more with this module and build your own all-connected empire easily.

This way, if a door is opened somewhere, a light is on in an empty room, or your AC is overworking at high speed, all you need is your phone to smoothly control each and every unit.

Lastly, this device has two connection points: RS232 and RS485. It is equipped with ASCII and Hexadecimal python in any baud rate.

This means limitless amounts of data can be sent and read per second, so you can command as many performances as you wish, and it's all done without interruption.
